MUMBAI - 400064

2025-2026

DECLARATION

I, Ms. Siddhi Gautam Santra, student of Bachelor of Computer Applications (BCA) Semester VI (2025-2026), hereby declare that the Project Report submitted to Shri M. D. Shah Mahila College has been entirely developed by me to fulfill the requirements of the final year project.

I affirm that this project has been completed within the specified time frame. The information provided by me is true and original to the best of my knowledge.

Siddhi Gautam Santra - _____

ACKNOWLEDGEMENT

I started this project as a part of the curriculum of B.C.A. which was assigned to me by "SHRI M.D. SHAH MAHILA COLLEGE". It was very exciting for me to work on my project "Bug Overflow".

I would like to express my sincere gratitude to everyone who contributed to the success of my project.

First, I extend my heartfelt thanks to SHRI M.D. SHAH MAHILA COLLEGE for providing me with the necessary resources and a conducive learning environment, which greatly aided the development of this project.

I am especially grateful to my project guides, Mrs. Manasi Ghule and Ms. Vaidehi Raval, for their invaluable guidance, constructive feedback, and unwavering support throughout the duration of this project.

I would also like to acknowledge the open-source community behind the MERN stack — MongoDB, Express.js, React.js, and Node.js — whose freely available tools and documentation made this project technically achievable.

Finally, I would like to thank my family and friends for their moral support and encouragement throughout this academic journey.

Siddhi Santra

SYNOPSIS

1. About Us

1.1 Project Name

BUG OVERFLOW

Bug Overflow is a full-stack web application developed as a capstone project for the Bachelor of Computer Applications (BCA) programme at SHRI M.D. SHAH MAHILA COLLEGE OF ARTS, SCIENCE & COMMERCE. The application replicates and substantially extends the core functionality of Stack Overflow — the world's largest and most widely referenced developer question-and-answer platform — using the MERN stack: MongoDB, Express.js, React.js, and Node.js.

The platform provides a rich, interactive environment where registered users can post technical questions, submit formatted answers with code blocks, vote on content quality, and formally accept the best answer. Beyond the Q&A loop, Bug Overflow incorporates a gamified reputation system, real-time notifications, full-text search, personal bookmarks, and a long-form article publishing module.

1.2 Member Details

Member Name	Programme	Roll No.
Siddhi Gautam Santra	TYBCA	52

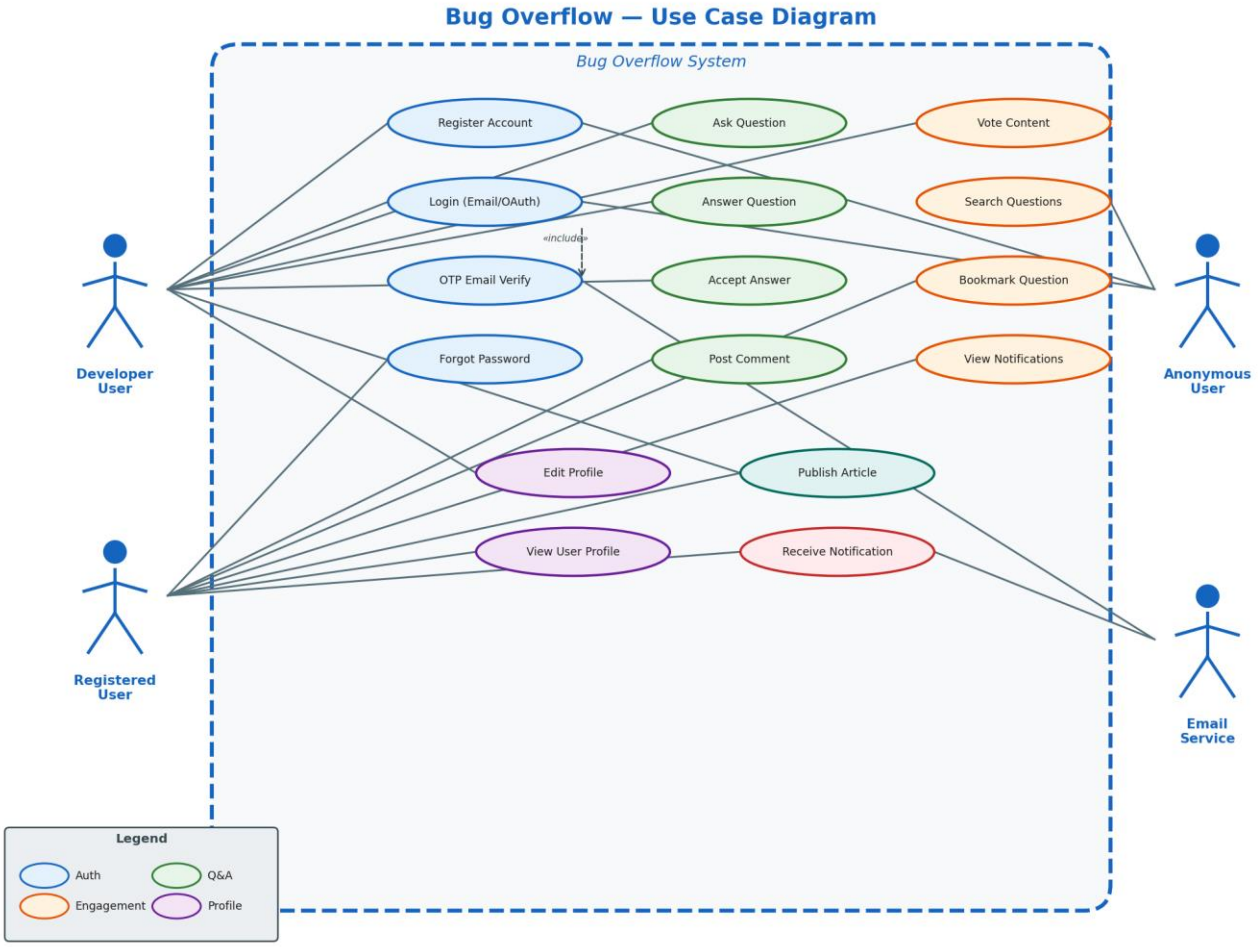
2. Project Introduction

2.1 Objective / Purpose

The overarching purpose of Bug Overflow is to demonstrate mastery of full-stack web development by building a production-grade, feature-rich platform that mirrors the design philosophy and functionality of real-world developer tools.

- Provide a structured environment for developers to post, discover, and resolve technical questions through peer-to-peer collaboration.
- Implement a gamified reputation system: +5 points per question upvote, +10 per answer upvote, +15 per accepted answer, with milestone badges (Informed, Enthusiast, Veteran, Expert).
- Deliver a secure, JWT-based authentication system using HTTP-only cookies and bcrypt password hashing.
- Offer a rich-text editing experience with React Quill — code blocks, bold, italic, lists, and inline formatting.
- Build a real-time notification system with unread count badge in the navigation bar.
- Integrate full-text search across all questions using MongoDB text indexes.
- Enable personal bookmarking so users can save and revisit questions of interest.
- Provide a long-form article publishing module for in-depth technical writing.
- Expose a rate-limited REST API with 40+ endpoints across 8 resource domains.

- Deliver a fully responsive, mobile-friendly UI using React 18 and React Router.



2.2 Comparison Between Existing Systems

The table below compares Bug Overflow against Stack Overflow and other developer Q&A platforms:

Feature	Bug Overflow (Our App)	Stack Overflow / Others
Login & Auth	Email/password + Google OAuth; JWT in HTTP-only cookies	Basic email login; OAuth rare in clones
Rich-Text Editor	React Quill with code blocks, syntax highlight, lists	Basic textarea or Markdown in most clones
Voting System	Upvote/downvote on questions and answers; real-time counts	Available in Stack Overflow; absent in most clones
Accept Answer	Question owner marks one answer as Accepted; sorted to top	Stack Overflow has this; most clones lack it
Reputation System	+5 question upvote, +10 answer upvote, +15 accepted answer	Stack Overflow has reputation; most clones do not
Achievement Badges	Informed, Enthusiast, Veteran, Expert at rep thresholds	Stack Overflow has badges; Quora/Reddit do not
Notifications	In-app feed for votes, answers, comments; unread count badge	Limited or absent in most Q&A clones
Full-Text Search	MongoDB text index across question titles and bodies	Elasticsearch in Stack Overflow; absent in clones
Bookmarks	Users save questions to personal bookmark list	Stack Overflow supports bookmarks; clones rarely do
Article Publishing	Long-form article module with rich-text editor	Dev.to / Hashnode focus on this; not in most clones
Rate-Limited API	40+ endpoints; express-rate-limit protection	No rate limiting in typical student clone projects
Password Security	bcrypt hashing with salt rounds 12	Many clones store plaintext passwords

2.3 Scope & Features (Modules)

- Module 1: Authentication & User Management — Secure registration, login, profile management, Google OAuth sign-in.
- Module 2: Question & Answer Engine — Post, edit, delete, vote, comment on, and accept answers.
- Module 3: Reputation & Badge System — Automatic score calculation and milestone badge assignment.
- Module 4: Real-Time Notifications — In-app notification feed with unread badge.
- Module 5: Full-Text Search — Index-backed keyword search across all questions.
- Module 6: Bookmarks — Personal save list for questions, persisted per user.
- Module 7: Article Publishing — Long-form rich-text article creation and listing.
- Module 8: REST API Layer — 40+ rate-limited, authenticated endpoints across 8 domains.

2.4 Key Features

2.4.1 Secure JWT Authentication

Sessions are managed via JWTs stored in HTTP-only cookies, preventing XSS token theft. Passwords use bcrypt with cost factor 12. Supports email/password and Google OAuth 2.0.

2.4.2 Rich-Text Question & Answer Editor

Powered by React Quill: syntax-highlighted code blocks, bold/italic, lists, and hyperlinks. Output HTML is sanitised by DOMPurify before storage to prevent XSS.

2.4.3 Gamified Reputation & Badge System

Upvotes on questions award +5 points; on answers +10; accepted answers award +15. Badges (Informed, Enthusiast, Veteran, Expert) are auto-granted at reputation thresholds.

2.4.4 Real-Time Notification System

Tracks votes, new answers, comments, and accepted answers. Nav badge shows unread count. Users can mark individual notifications as read or clear all at once.

2.4.5 Full-Text Search

MongoDB text index on question title and body fields. Returns keyword-matched questions in milliseconds, reducing duplicate questions and improving content quality.

2.4.6 Bookmarks & Saved Questions

Single-click bookmarking, persisted per user. View saved questions from the profile dashboard — building a personalised reference library.

2.4.7 Long-Form Article Publishing

Authors compose in-depth guides using the same rich-text editor. Articles are published to a public feed, extending Bug Overflow beyond Q&A into a knowledge platform.

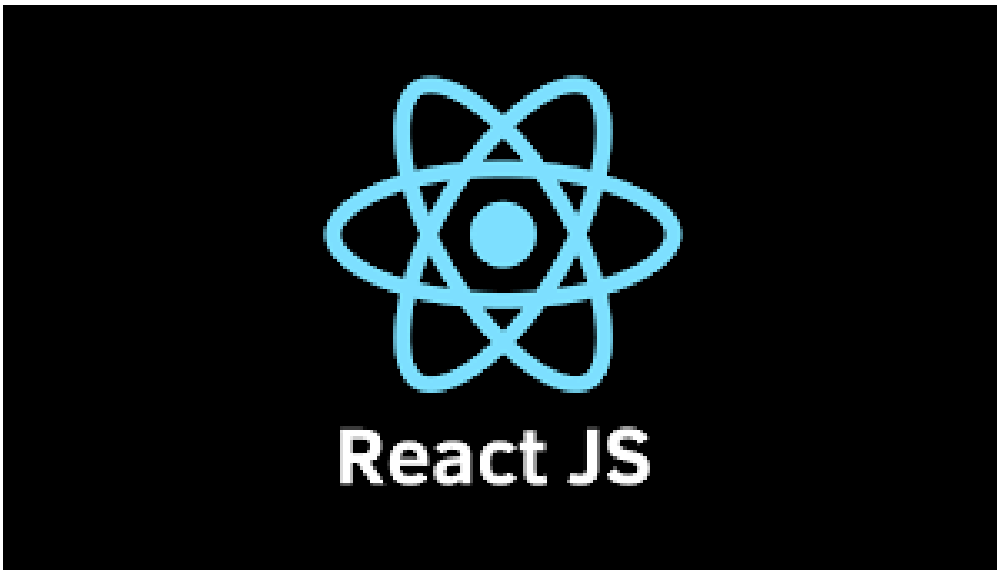
2.4.8 Rate-Limited REST API

40+ endpoints across 8 domains: users, questions, answers, votes, comments, notifications, bookmarks, articles. Protected by express-rate-limit: 200 req/15 min global, 20 req/15 min auth.

3. Technology Specifications

Bug Overflow is built on the MERN stack — MongoDB, Express.js, React.js, and Node.js — a modern JavaScript-first combination enabling full-stack development with a single language across client and server.

3.1.1 React.js (v18)



Declarative, component-based library by Meta. React 18 introduces concurrent rendering and automatic batching. Uses hooks (useState, useEffect), React Router v6 for navigation, and JSX for UI composition.

3.1.2 Redux (State Management)

Centralises global state: authenticated user, notification count, search query. Redux Toolkit's createSlice and createAsyncThunk reduce boilerplate. Redux DevTools accelerate debugging.

3.1.3 React Quill (Rich-Text Editor)

React wrapper for Quill.js. Custom toolbar: bold, italic, headings, lists, blockquote, code blocks, hyperlinks. Outputs sanitised HTML stored in MongoDB.

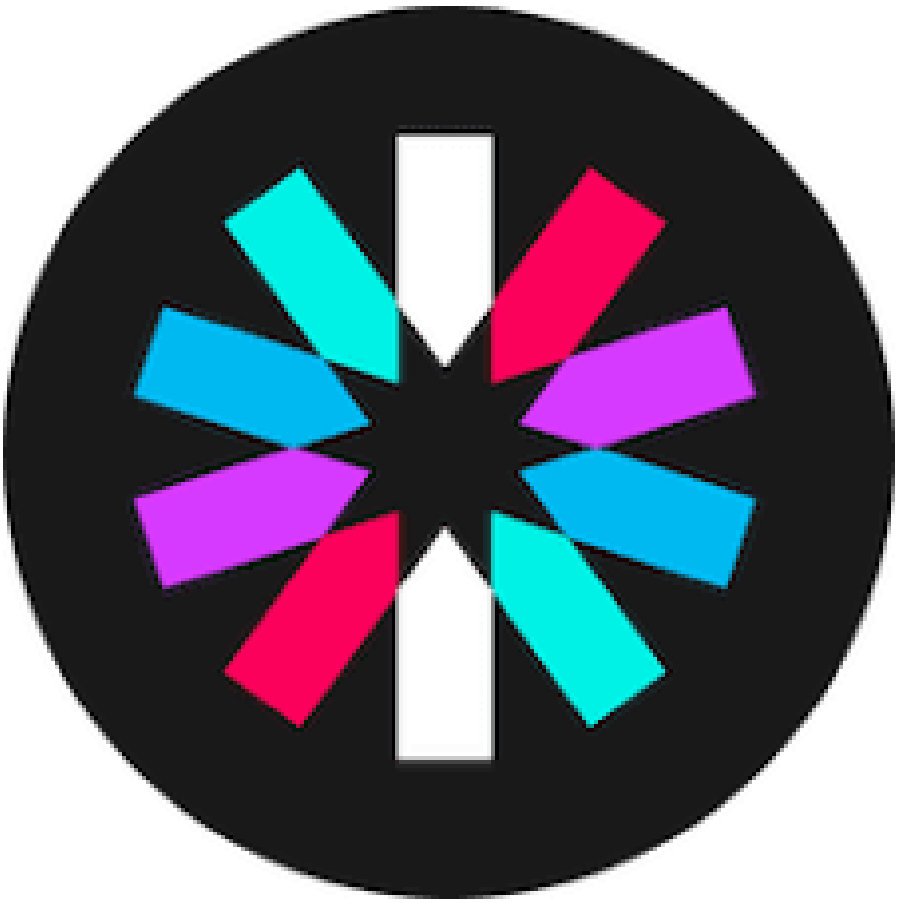
3.2.1 Node.js

Non-blocking, event-driven V8 runtime. Handles concurrent connections without multi-threading overhead. Enables full-stack JavaScript development.

3.2.2 Express.js

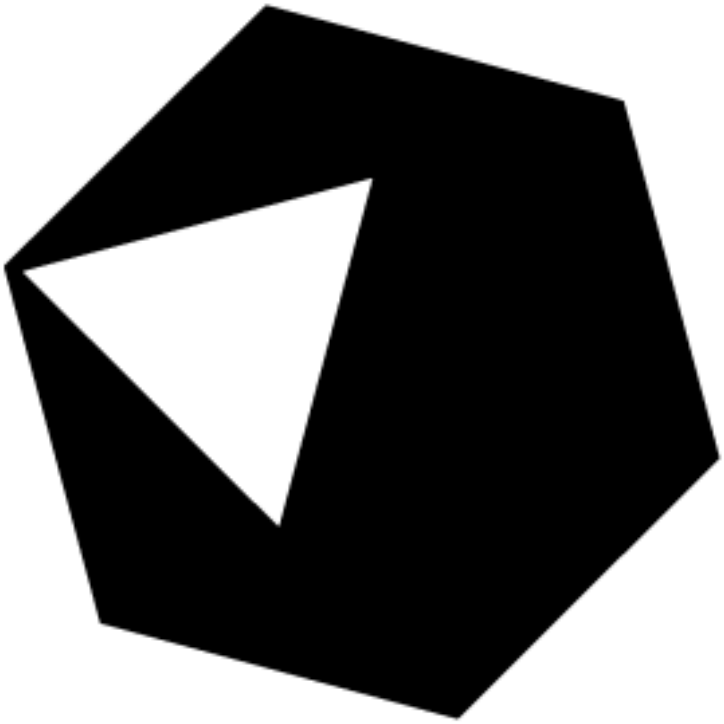
Minimal Node.js web framework. 8 route modules. Middleware pipeline: rate-limiter → CORS → cookie-parser → JSON-parser → route handler → error handler.

3.2.3 JSON Web Tokens (JWT)



HS256-signed JWTs in HTTP-only cookies. Token expiry: 7 days. Auth middleware verifies on every protected request; returns 401 on missing/expired/tampered tokens.

3.2.4 bcrypt (Password Hashing)



Salt-based hashing with cost factor 12 (4,096 iterations). Constant-time compare() prevents timing attacks. Plaintext passwords never stored.

3.3.1 MongoDB (NoSQL Database)

Document-oriented BSON storage. 8 collections: users, questions, answers, comments, articles, notifications, bookmarks. Mongoose ODM for schema validation. Text indexes power full-text search.

3.4 System Requirements

Component	Specification
Operating System	Windows 10/11, macOS 12+, or Ubuntu 20.04+
Processor	Intel Core i5 (8th gen+) or AMD Ryzen 5 equivalent
RAM	8 GB minimum; 16 GB recommended
Storage	10 GB free disk space
Node.js Version	Node.js v18 LTS or higher
MongoDB Version	MongoDB 6.0+ (local) or MongoDB Atlas (cloud)
Browser	Chrome 110+, Firefox 110+, Edge 110+
Internet	Required for Google OAuth, CDN assets, MongoDB Atlas
IDE	VS Code with ESLint, Prettier, REST Client extensions

4. Beneficiary

4.1 Advantages

- Developers & Students: Searchable peer-reviewed solutions. Reputation system incentivises quality contributions.
- Experts & Senior Engineers: Share expertise through answers and long-form articles. Build public professional profiles.
- Development Teams: Reduce duplicated effort. Bookmark and share resources across the team.
- Project Author: Hands-on MERN stack experience, API design, NoSQL modelling, security implementation, and deployment.

4.2 Client Details

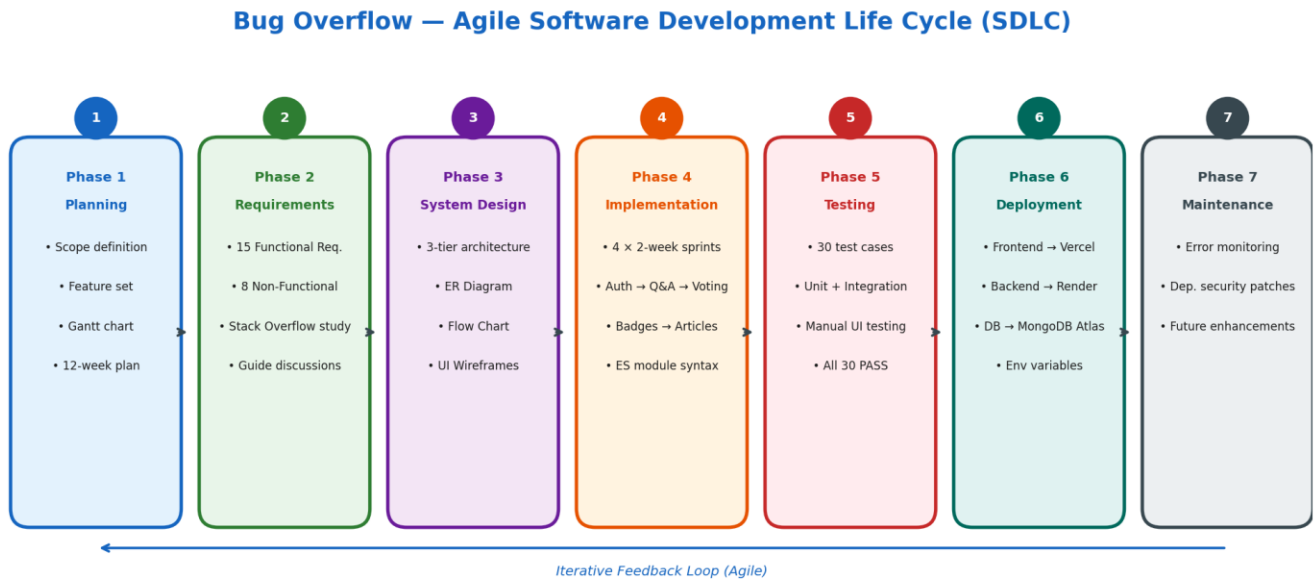
- BCA / CS Students encountering programming challenges in coursework and projects.
- Junior Developers resolving unfamiliar errors quickly without lengthy search sessions.
- Full-Stack and Freelance Developers needing code-level, community-validated help.
- Technical Educators creating reusable knowledge bases for recurring student questions.

4.3 User Details

User Group	How Bug Overflow Serves Them
BCA / CS Students	Searchable archive of solved problems; reputation and badges for academic engagement.
Junior Developers	Resolve on-the-job errors; receive vetted answers; build professional reputation.
Senior Engineers	Share expertise via detailed answers and long-form articles; mentor juniors.
Freelancers	Resolve issues across diverse client projects; bookmark solutions for recurring problems.
Technical Educators	Publicly answer common questions; write articles to supplement course material.

SOFTWARE DEVELOPMENT LIFE CYCLE (SDLC)

Bug Overflow was developed following the Agile Software Development Life Cycle model. Agile was chosen because it allows iterative development with continuous feedback, making it well-suited to a project where features were added incrementally and requirements evolved during development.



Phase 1: Planning

The project scope and objectives were defined. The decision to model the application on Stack Overflow was made, and a high-level feature set was finalised. A project timeline spanning 12 weeks was prepared using a Gantt chart.

Phase 2: Requirements Analysis

Functional and non-functional requirements were elicited through study of the Stack Overflow platform and discussions with the project guide. A total of 15 functional requirements and 8 non-functional requirements were identified.

Phase 3: System Design

Architecture designed as three-tier: React frontend (presentation), Express/Node.js REST API (business logic), and MongoDB Atlas (data layer). ER diagrams, use-case diagrams, data-flow diagrams, and UI wireframes were produced.

Phase 4: Implementation (Coding)

Development in four two-week sprints. Sprint 1: authentication. Sprint 2: questions and answers. Sprint 3: voting, reputation, badges. Sprint 4: notifications, bookmarks, articles, search.

Phase 5: Testing

30 test cases covering all modules were designed and executed. All 30 test cases passed. Minor UI alignment issues identified and resolved.

Phase 6: Deployment

React frontend deployed to Vercel; Express backend to Render; MongoDB Atlas provides the cloud-hosted database. Environment variables keep secrets out of source code.

Phase 7: Maintenance

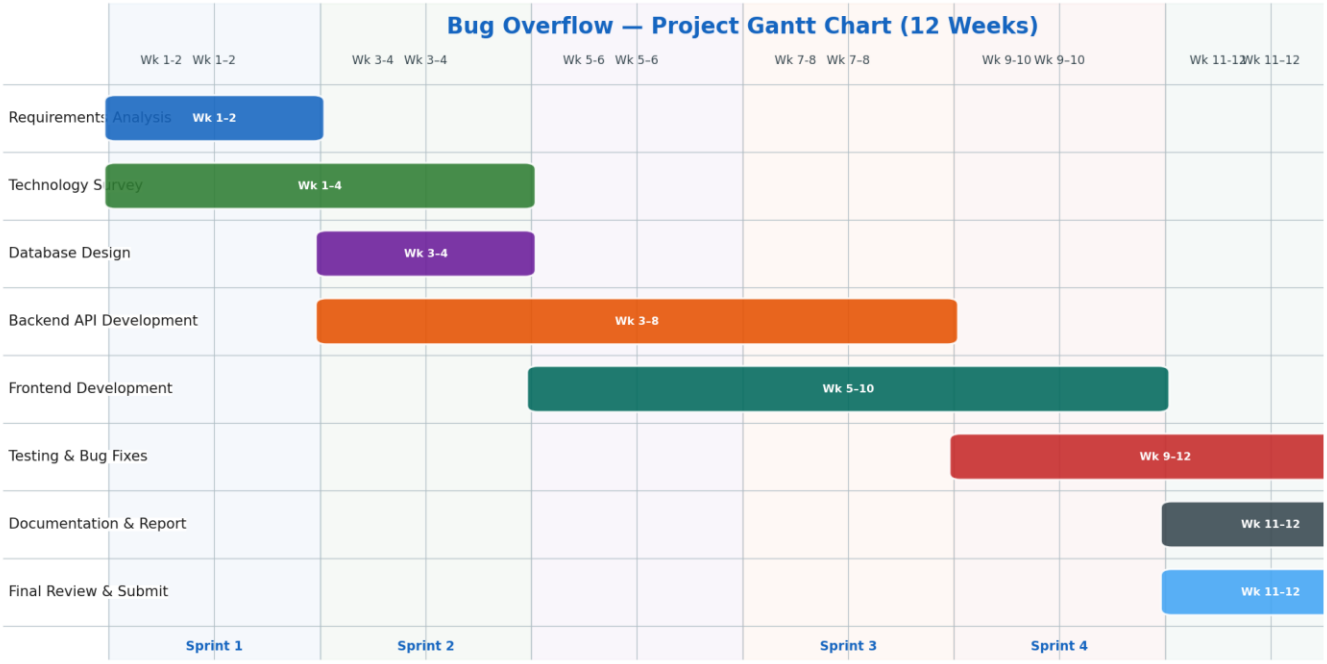
Post-deployment: monitoring error logs, updating dependencies for security patches, and implementing future enhancements listed in Section 10.

SYSTEM PLANNING

System planning defines the project's scope, timeline, resource allocation, and risk management strategy.

3.1 Gantt Chart

The following Gantt chart outlines the project timeline across 12 weeks:



The project followed an Agile approach with four two-week sprints. Requirements analysis and technology survey were completed in the first four weeks. Backend development began in Week 3 and ran

through Week 8. Frontend development overlapped from Week 5. All 30 test cases were executed in Weeks 9–12.

SYSTEM ANALYSIS

System analysis involves understanding the problem domain, studying existing systems, identifying requirements, and assessing feasibility.

4.1 Requirement Gathering

Requirements were gathered through:

- Study of the Stack Overflow platform to understand industry-standard Q&A features.
- Review of academic requirements for a final-year IT project (full-stack, database-driven, 8+ modules).
- Iterative discussions with the project guide to refine scope and priorities.

Functional Requirements

ID	Functional Requirement
FR-01	Users shall register with email and password and verify their email via OTP.
FR-02	Users shall log in with email/password or Google OAuth.
FR-03	Authenticated users shall post questions with title, rich-text body, and tags.
FR-04	Authenticated users shall post rich-text answers to any question.
FR-05	Authenticated users shall upvote or downvote questions and answers.
FR-06	Question owners shall accept one answer as the correct solution.
FR-07	Users shall post comments on questions and answers.
FR-08	Users shall search questions by keyword or tag.
FR-09	Reputation shall update automatically on vote and accept events.
FR-10	Badges shall be awarded when reputation thresholds are reached.
FR-11	Users shall receive notifications for votes, answers, and comments.
FR-12	Users shall bookmark questions for later reference.
FR-13	Users shall write and publish technical articles.
FR-14	Users shall edit their profile including avatar and bio.
FR-15	Users shall view other users profiles, questions, and answers.

Non-Functional Requirements

ID	Non-Functional Requirement
NFR-01 – Security	Passwords hashed with bcrypt; JWTs in HTTP-only cookies; HTML sanitised with DOMPurify.
NFR-02 – Performance	API responses under 300ms for typical queries with up to 10,000 questions.
NFR-03 – Scalability	MERN stack supports horizontal scaling; MongoDB Atlas auto-scales storage.
NFR-04 – Rate Limiting	express-rate-limit: 200 req/15 min global; 20 req/15 min for auth endpoints.
NFR-05 – Usability	UI responsive and accessible on desktop and mobile browsers.
NFR-06 – Reliability	System handles invalid input with appropriate error messages.
NFR-07 – Maintainability	Code follows ES module standards with clear separation of concerns.
NFR-08 – Availability	Application deployable to cloud platforms (Render, Vercel).

4.2 Module (Waterfall)

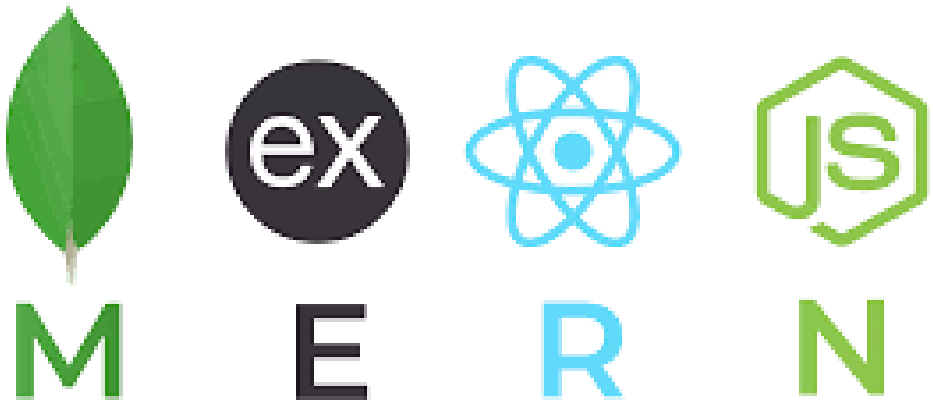
While the overall lifecycle used Agile, each individual module was designed using Waterfall: Requirements → Design → Code → Test → Integration.

- Authentication Module: Register, OTP email verification, login, logout, Google OAuth, password reset.
- Question Module: Post, edit, delete, view, paginate, and search questions.
- Answer Module: Post, edit, delete, upvote, downvote, and accept answers.
- Comment Module: Add and delete comments on questions and answers.
- Voting Module: Upvote/downvote with reputation side-effects.
- Reputation & Badge Module: Points on vote/accept; badges auto-granted at thresholds.
- Bookmark Module: Save/remove questions to personal bookmark list.
- User Profile Module: Stats, questions, answers, badges; avatar and bio editing.
- Search Module: Full-text search via MongoDB text indexes; tag-based filtering.
- Article Module: Create, edit, delete, and publish long-form technical articles.

4.3 Feasibility Study

Technical Feasibility

The MERN stack is a proven, industry-standard technology combination. All required libraries (React, Express, Mongoose, JWT, bcryptjs, Nodemailer, React Quill) are open-source, actively maintained, and have extensive community support.



Economic Feasibility

The entire project was built using free, open-source tools. MongoDB Atlas, Vercel, and Render all offer free tiers sufficient for a college-level deployment. Total development cost: zero monetary expenditure.

Operational Feasibility

The application addresses a real need — developers and students frequently require a platform to ask and answer technical questions. The Stack Overflow-inspired UI minimises the learning curve for new users.

Schedule Feasibility

The 12-week timeline is achievable. The Gantt chart demonstrates that all phases fit within the academic semester without overlap conflicts.

4.4 Software Specification

Component	Technology	Version
Operating System	Windows 10 / Ubuntu 20.04 / macOS	Any
Frontend Framework	React.js	18.x
Backend Runtime	Node.js	18 LTS
Web Framework	Express.js	4.x
Database	MongoDB Atlas	6.0+
ODM	Mongoose	7.x
Auth Library	jsonwebtoken + bcryptjs	9.x + 2.x
Rich-Text Editor	React Quill	2.x
State Management	Redux Toolkit	1.x
HTTP Client	Axios	1.x
Rate Limiting	express-rate-limit	7.x
Code Editor	Visual Studio Code	Latest
Version Control	Git / GitHub	Latest

4.5 Tool & Technology

- React.js 18: JavaScript library for building UIs. Uses function components and hooks for state management and side effects.
- Node.js 18 LTS: Server-side JavaScript runtime; hosts the Express REST API using ES module syntax (import/export).
- Express.js 4: Minimal, flexible web framework for Node.js. Handles routing, middleware, and HTTP lifecycle.
- MongoDB 6.0 + Mongoose 7: NoSQL document database with ODM for schema definition and validation.
- jsonwebtoken: Signs and verifies JWTs for stateless session management.
- bcryptjs: Salted password hashing with configurable cost factor for secure credential storage.
- Nodemailer: Sends OTP emails for account verification and password reset via SMTP.
- React Quill: WYSIWYG rich-text editor supporting headings, bold, italic, code blocks, bullet lists, and hyperlinks.
- express-rate-limit: Throttles API requests — 200 req/15 min global, 20 req/15 min for auth endpoints.
- Axios: Promise-based HTTP client used on the React frontend to call the backend REST API.
- DOMPurify: Sanitises HTML from the rich-text editor before rendering to prevent XSS attacks.
- Redux Toolkit: Manages global app state (user profile, notification count, search query).
- Git / GitHub: Version control and remote repository hosting.

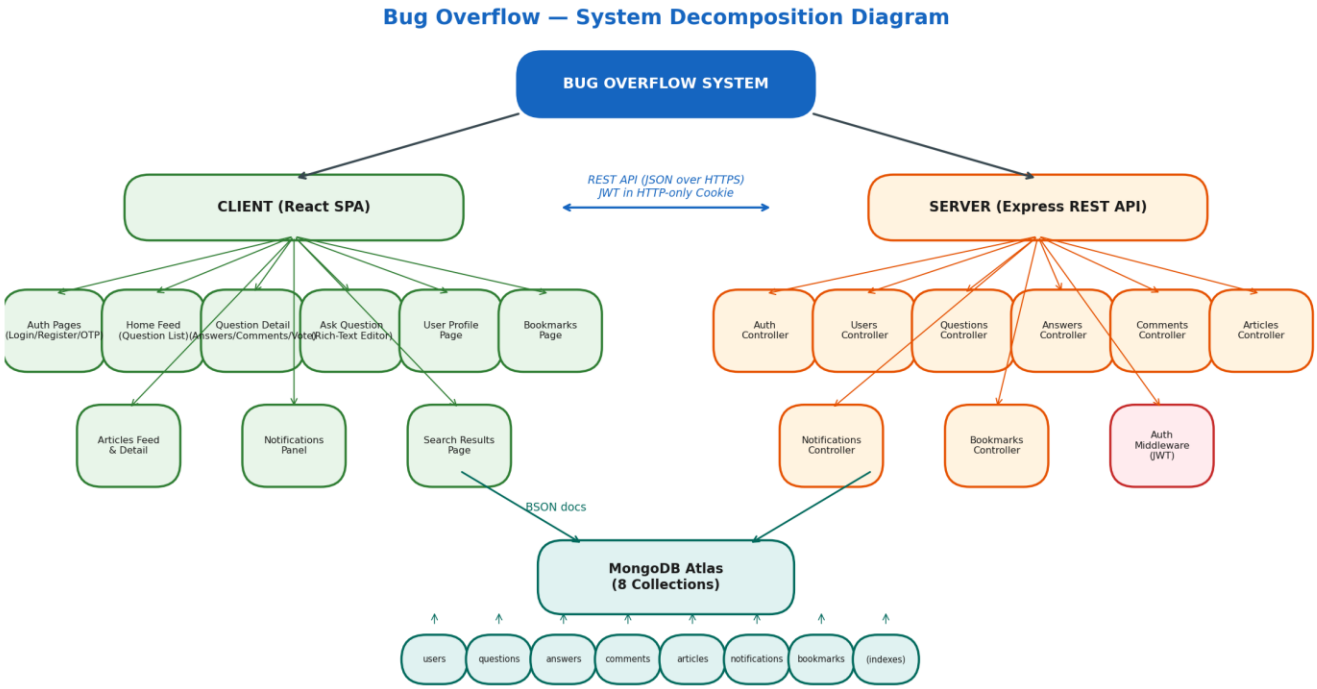
- Visual Studio Code: Primary IDE with ESLint, Prettier, and Thunder Client extensions.
- Vercel / Render: Cloud deployment platforms for React frontend and Express backend.
- MongoDB Atlas: Cloud-hosted MongoDB database with automatic backups and monitoring.

SYSTEM DESIGN

System design translates the requirements into a concrete technical architecture. This section documents the decomposition, control flow, data model, and user interface design of Bug Overflow.

5.1 Decomposition Diagram

Bug Overflow is decomposed into two top-level subsystems: the React Frontend (Client) and the Node/Express Backend (Server):



```
BUG OVERFLOW SYSTEM
├── CLIENT (React SPA)

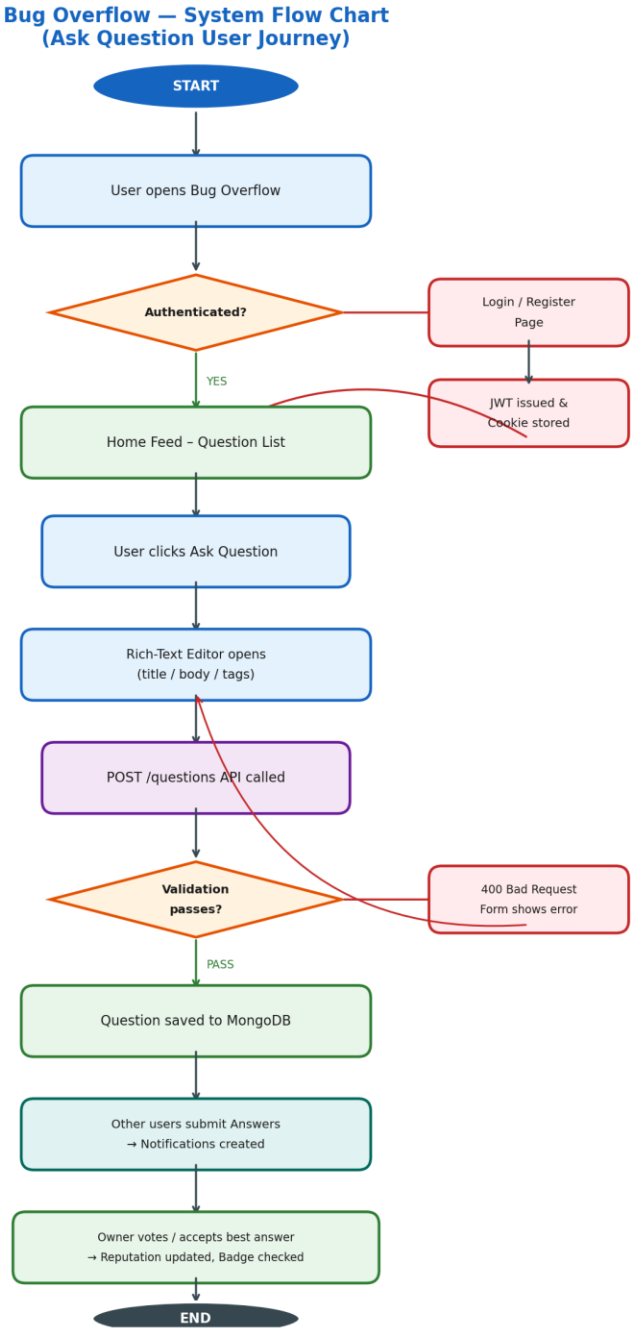
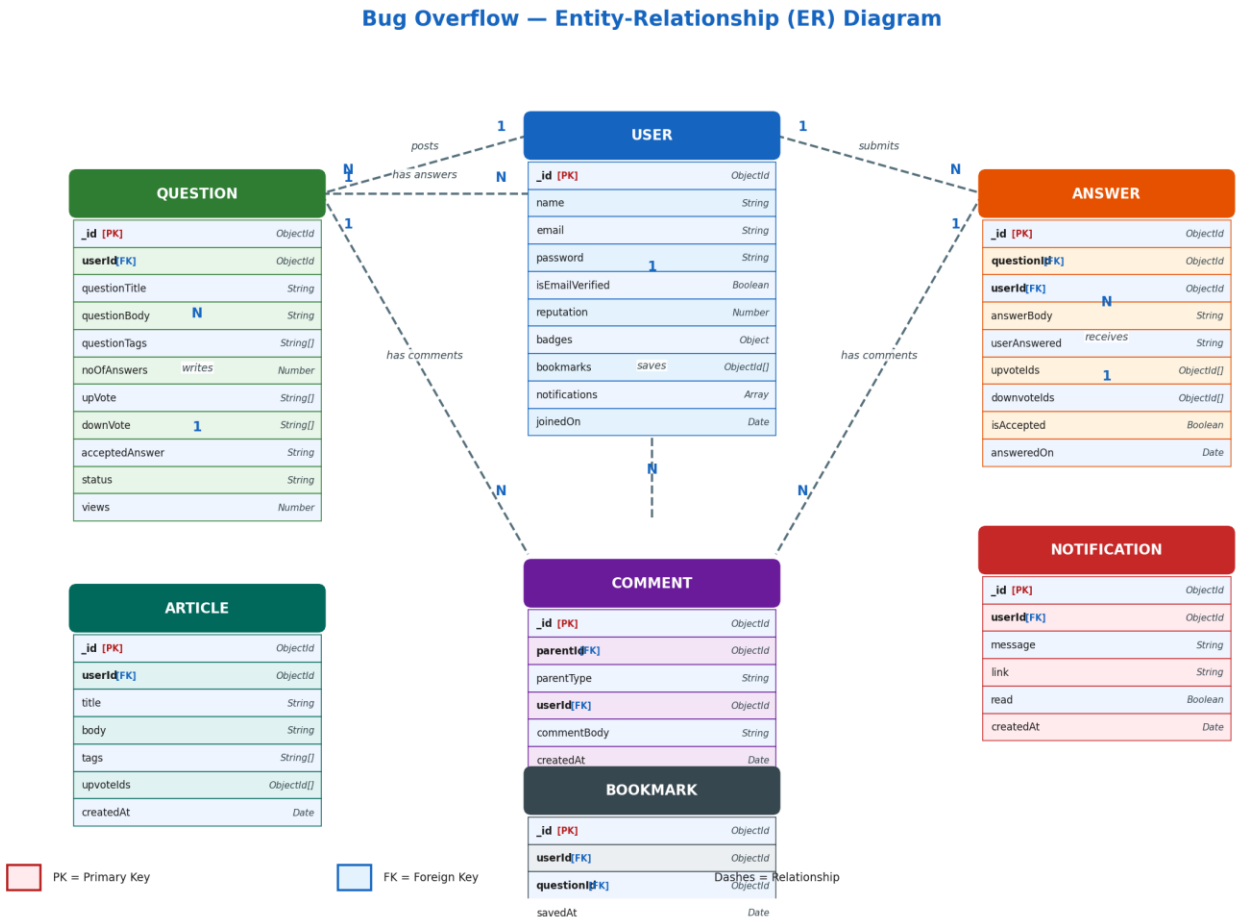
5.2 Flow Chart

Primary user journey — asking a question and receiving community answers:



5.3 Entity-Relationship (ER) Diagram

The Bug Overflow database consists of 8 MongoDB collections:



Key relationship attributes:

- QUESTION stores upvoteIds[] and downvoteIds[] (arrays of User ObjectIds) for O(1) vote lookup.
- ANSWER stores upvoteIds[], downvoteIds[], and an isAccepted boolean.
- USER stores reputation (Number), badges{} object, and bookmarks[] (Question ObjectId array).
- NOTIFICATION is embedded as a sub-document array inside the User document.

5.4 Data Schema

User Schema (users collection)

_id	ObjectId	Primary key (auto-generated)
name	String	Display name (required)
email	String	Unique email address (required)
password	String	bcrypt hash (required)
isEmailVerified	Boolean	True after OTP verification
otp	String	6-digit OTP hash for email verification
otpExpiry	Date	OTP expiry timestamp (10 minutes)
reputation	Number	Gamification score (default 1)
badges	Object	bronze[], silver[], gold[] string arrays
bookmarks	String[]	Bookmarked Question _ids
notifications	Array	Embedded notification sub-documents
joinedOn	Date	Account creation timestamp
about	String	User bio / about text
location	String	User location
links	Object	website, x (Twitter), github URLs

Question Schema (questions collection)

Field	Type	Description
_id	ObjectId	Primary key
questionTitle	String	Question title (required)
questionBody	String	Rich HTML body (required)
questionTags	String[]	Tag array (required)
noOfAnswers	Number	Cached answer count (default 0)
upVote	String[]	User IDs who upvoted
downVote	String[]	User IDs who downvoted
userPosted	String	Author display name
userId	String	Author User _id reference
askedOn	Date	Creation timestamp
views	Number	View count (default 0)
acceptedAnswer	String	Accepted Answer _id or null
status	String	open / closed / answered
comments	Array	Embedded comment sub-documents

Answer Schema (answers collection)

Field	Type	Description
_id	ObjectId	Primary key
questionId	ObjectId	Parent question reference
answerBody	String	Rich HTML answer content
userAnswered	String	Author display name
userId	String	Author User _id reference
answeredOn	Date	Creation timestamp
upvoteIds	ObjectId[]	Users who upvoted
downvoteIds	ObjectId[]	Users who downvoted
isAccepted	Boolean	True if accepted by question owner
comments	Array	Embedded comment sub-documents

Is that allowed? Authentication and authorization in Model Context Protocol

by aleks • 5 hours ago

MCP mcp-server auth

Share Remove Bookmark Edit Delete

Learn how to protect MCP servers from unauthorized access and how authentication of MCP clients to MCP servers works.

Credit: Alexandra Francis

Model Context Protocol (MCP), released in late 2024, is an emerging standard for communication between AI agents and services used to complete tasks.

By using MCP, you can expose functionality to a variety of agents, from desktop clients to autonomous LLM-based agents running on other systems. After configuration, agents take the prompts and determine which MCP servers and MCP features to use to accomplish the goal of the prompt.

Yeah, I find it a bit spooky too.

An MCP server is similar to a REST API: it offers standardized remote access to resources, data, and functionality.

In this article, you'll learn about how to protect MCP servers from unauthorized access and how authentication of MCP clients to MCP servers works. Both users of MCP servers and those who build them will benefit from a deeper understanding of this authentication layer.

This article assumes you are familiar with the basics of MCP, otherwise you might want to review the MCP specification or this introductory article.

There have been a few versions of MCP, but the three that relevant to authorization are:

- The 2025-03-26 version
- The 2025-06-18 version
- The 2025-11-25 version
- The version under development, of which you can view a draft.

If you are building MCP servers, make sure you understand which version your clients support since that affects the capabilities you can offer. This article focuses on the 2025-11-25 specification, with occasional information about the more widely implemented 2025-06-18 version.

If you are reading this more than a few months into 2026, **check the latest version** of the specification and ensure you understand any changes.

Authentication and authorization's current status

What is the current status of authentication and authorization in MCP? These occur at the transport layer. There are currently two supported transport technologies:

- stdio
- Streamable HTTP

Let's take a look at each of these, and how authentication happens.

Standard Input/Output (stdio)

This transport runs the MCP server as a local process. These are also called "local" MCP servers. All communication takes place over standard input and standard output.

When you pipe a request to curl, you are usually implicitly authenticated. Similarly, with the stdio transport, no authentication between the MCP client and MCP server is required. The MCP server is started as a subprocess of the MCP client.

Environment variables configure the MCP server. For example, you can set an environment variable with the value of an endpoint URL to the server. The server then can use that environment variable at startup to connect to the correct service endpoint. Environment variables are perfect for configuration during the MCP server boot up process. While data can be passed, no explicit authentication takes place between the MCP client and the MCP server.

You can manage the authorization process of services behind the MCP server by providing environment variables. If the MCP server supports it, you can add an API key environment variable. The MCP server can use this variable to connect to backend services, which can limit functionality and data based on the API key. The specifics of this authorization process vary by MCP server.

Just like a curl request can be authenticated using basic auth, an API key, or an OAuth token, the request between the MCP server and the APIs or services it relies upon can be authenticated in the same way.

The exact mechanism for authentication and authorization for requests made by an MCP server is outside the scope of the MCP specification. But you darn well need one. We'll talk more about this issue below.

We won't discuss the stdio transport again, since most of the authentication complexity occurs when you have a remote MCP server using the streamable HTTP transport. Let's take a look at that transport next.

Streamable HTTP

This transport, introduced in the 2025-06-18 specification, uses the OAuth 2.1 protocol and other standards-based solutions to authenticate and authorize MCP clients. MCP servers that use this transport are called remote MCP servers, whether the MCP server lives on localhost, a private URL or a public URL.

However, you can have a remote MCP server that requires no authentication or authorization. An example of this is the context7 MCP servers. These are remote MCP servers, but because they surface documentation and are read-only, they don't require any verification of the MCP client. Such MCP servers are in the minority, though.

Most MCP servers allow MCP clients to take action, and therefore need to know who the MCP client is and what it can do.

For such MCP servers, you use an OAuth flow. To use the OAuth terms:

- the MCP client is an OAuth 2.1 client
- the MCP server is an OAuth 2.1 resource server
- there is an authorization server

The authorization server is responsible for authenticating the MCP client, getting end user consent for the actions it is going to take, and issuing a token to the client. The client then presents the token to the MCP server, which validates it to ensure the client is authenticated and authorized. Per the MCP specification, the authorization process is an optional recommendation, but remote servers are strongly recommended to implement it.

We'll dig into this OAuth process a lot more below.

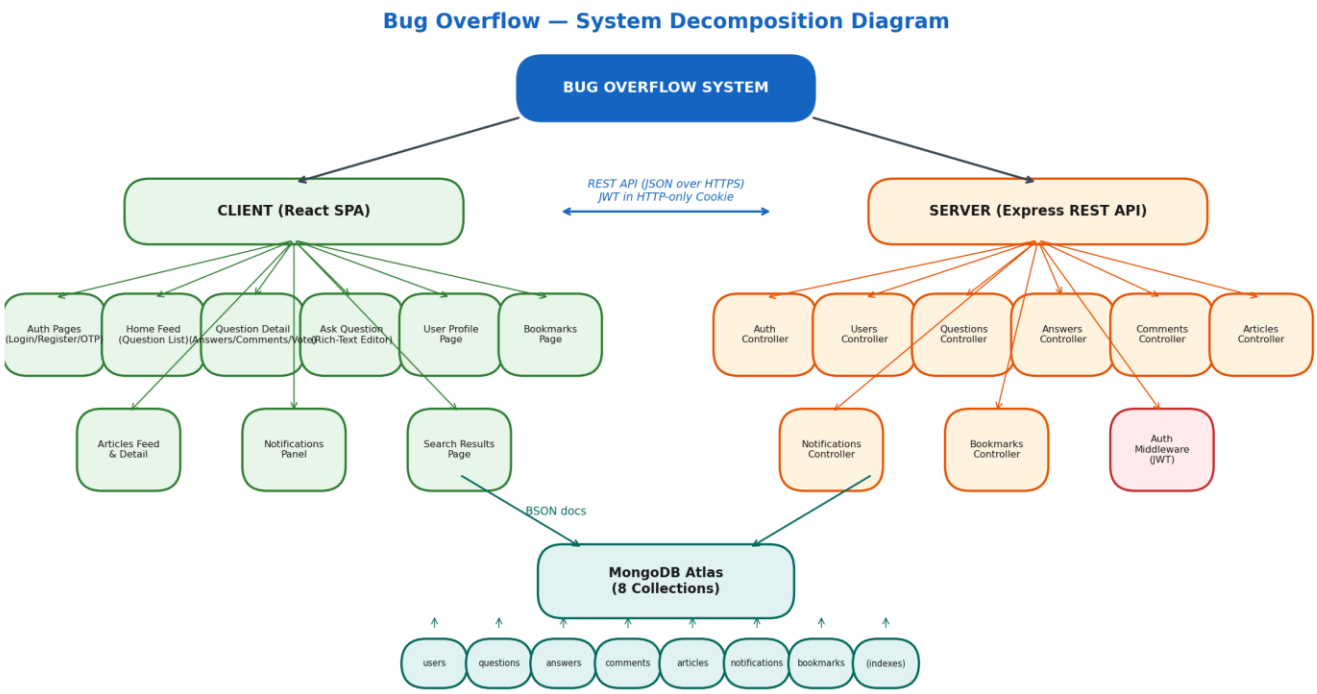
SYSTEM CODING

This section presents key source code files from the Bug Overflow project. All code follows ES module syntax (import/export) with clean separation of concerns.



6.1 Code

Server Entry Point (server/index.js)

```
import express from "express";
import cors from "cors";
import dotenv from "dotenv";
import rateLimit from "express-rate-limit";
import userRoutes from "./routes/users.js";
```

```
import questionRoutes from "./routes/Questions.js";
import answerRoutes from "./routes/Answers.js";
import commentRoutes from "./routes/Comments.js";

```

Database Connection (server/connectMongoDb.js)

```
import mongoose from "mongoose";

const connectDB = async () => {
  try {
    const conn = await mongoose.connect(process.env.CONNECTION_URL, {
      useNewUrlParser: true, useUnifiedTopology: true,
    });
    console.log(`MongoDB connected: ${conn.connection.host}`);
  } catch (error) {
    console.error(error);
    process.exit(1);
  }
};
export default connectDB;
```

Auth Middleware (server/middleware/auth.js)

```
import jwt from "jsonwebtoken";

const auth = (req, res, next) => {
  try {
    const authHeader = req.headers?.authorization;
    if (!authHeader) return res.status(401).json({ message: "Token
missing" });
    const token = authHeader.split(" ")[1];
    const decodeData = jwt.verify(token, process.env.JWT_SECRET);
    req.userId = decodeData?.id;
    if (!req.userId) return res.status(401).json({ message: "Invalid
payload" });
    next();
  } catch (error) {
    if (error?.name === "TokenExpiredError")
      return res.status(401).json({ message: "Token expired." });
    return res.status(401).json({ message: "Invalid token" });
  }
};
export default auth;
```

User Model (server/models/auth.js)

```
import mongoose from "mongoose";

const userSchema = mongoose.Schema({
  name:            { type: String, required: true },
  email:           { type: String, required: true },
  password:        { type: String, required: true },
  isEmailVerified: { type: Boolean, default: false },
  reputation:      { type: Number, default: 1 },
  badges: {
    bronze: { type: [String], default: [] },
    silver: { type: [String], default: [] },
    gold:   { type: [String], default: [] },
  },
  bookmarks:     { type: [String], default: [] },
  notifications: [{ message: String, link: String, read: Boolean,
createdAt: Date }],
  joinedOn: { type: Date, default: Date.now },
});
export default mongoose.model("User", userSchema);
```

Reputation Utility (server/utils/reputation.js)

```
import Users from "../models/auth.js";

export const computeBadges = (user) => {
  const rep = user.reputation ?? 1;
  const bronze = new Set(user.badges?.bronze ?? []);
  const silver = new Set(user.badges?.silver ?? []);
  const gold   = new Set(user.badges?.gold   ?? []);
  if (rep >= 1)   bronze.add("Informed");
  if (rep >= 10)  bronze.add("Enthusiast");
  if (rep >= 50)  silver.add("Veteran");
  if (rep >= 200) gold.add("Expert");
  return { bronze: [...bronze], silver: [...silver], gold:
[...gold] };
};

export const updateReputation = async (userId, delta) => {
  const user = await Users.findById(userId);
  if (!user) return null;
  user.reputation = Math.max(1, (user.reputation ?? 1) + delta);
  user.badges = computeBadges(user);
  await user.save();
  return user;
};
```

Auth Controller – signup() (server/controllers/auth.js)

```
export const signup = async (req, res) => {
  const { name, email, password } = req.body;
  try {
    if (!name || !email || !password)
      return res.status(400).json({ message: "Name, email and
password are required." });
    if (password.length < 6)
      return res.status(400).json({ message: "Password must be at
least 6 characters." });
    const existing = await users.findOne({ email });
    if (existing && existing.isEmailVerified)
      return res.status(409).json({ message: "User already exists.
Please log in." });
    const hashedPassword = await bcrypt.hash(password, 12);
    const otp = generateOtp();
    // create user, send OTP email
    res.status(201).json({ message: "OTP sent to email." });
  } catch (error) {
    res.status(500).json({ message: error.message });
  }
};
```

Questions Controller – postQuestion() & searchQuestions()

```
export const postQuestion = async (req, res) => {
  const postQuestionData = req.body;
  const postQuestion = new Questions({ ...postQuestionData, userId:
req.userId });
  try {
    await postQuestion.save();
    updateReputation(req.userId, 0, { hasAskedQuestion:
true }).catch(console.error);
    res.status(200).json("Posted a question successfully");
  } catch (error) { res.status(409).json("Couldn't post a new
question"); }
};

export const searchQuestions = async (req, res) => {
  const { q, limit = 10, skip = 0 } = req.query;
  const filter = { $or: [
    { questionTitle: { $regex: q, $options: "i" } },
    { questionBody:  { $regex: q, $options: "i" } },
    { questionTags:  { $elemMatch: { $regex: q, $options: "i" } } },
  ]};
  const total = await Questions.countDocuments(filter);
  const questions = await Questions.find(filter).sort({ askedOn: -
1 })
    .skip(Number(skip)).limit(Number(limit)).lean();
  res.status(200).json({ questions, total });
};
```

6.2 Validation Code

Frontend Form Validation (client/AskQuestion.jsx)

```
const handleSubmit = (e) => {
  e.preventDefault();
  if (!title.trim()) { alert("Question title cannot be empty.");
return; }
  if (title.length < 15) { alert("Title must be at least 15
characters."); return; }
  if (!body.trim() || body === "<p><br></p>") {
    alert("Question body cannot be empty."); return;
  }
  if (tags.length === 0) { alert("Please add at least one tag.");
return; }
  dispatch(askQuestion({ questionTitle: title, questionBody: body,
    questionTags: tags }, navigate));
};
```

SYSTEM TESTING

System testing verifies that Bug Overflow meets all functional and non-functional requirements. A total of 30 test cases were designed covering all major modules.

7.1 Quality Assurance

All 30 test cases with module, description, expected result, and status:

TC #	Module	Test Description	Expected Result	Status
TC-01	Auth	Register with valid email and password	User created; JWT cookie set	Pass
TC-02	Auth	Register with duplicate email	400: Email already exists	Pass
TC-03	Auth	Register with missing fields	400: Required fields missing	Pass
TC-04	Auth	Login with valid credentials	200: tokens issued; user data returned	Pass
TC-05	Auth	Login with wrong password	401: Invalid credentials	Pass
TC-06	Auth	Access protected route without token	401: Unauthorised	Pass
TC-07	Auth	Access with expired token	401: Token expired	Pass
TC-08	Questions	Post question with valid title/body/tags	201: Question saved in DB	Pass
TC-09	Questions	Post question with empty title	400: Title required	Pass

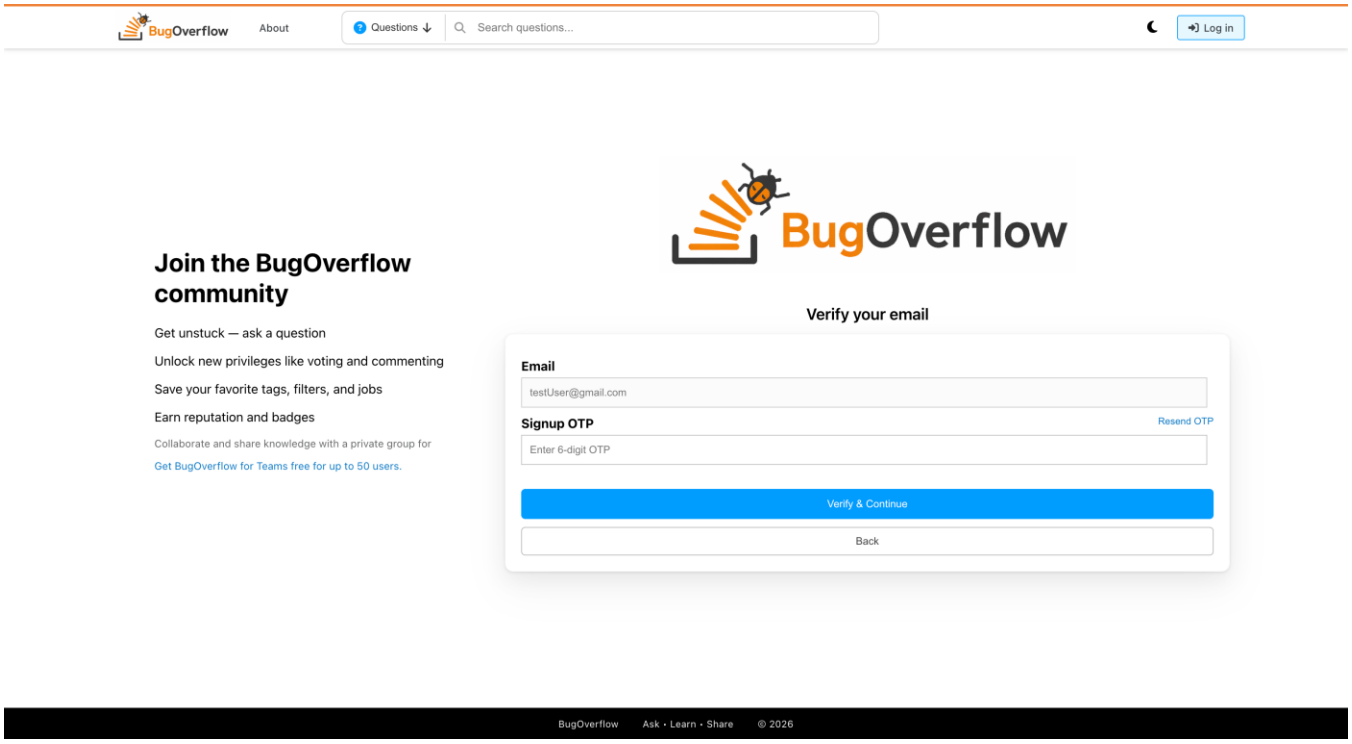
TC #	Module	Test Description	Expected Result	Status
TC-10	Questions	Post question with no tags	400: Tags required	Pass
TC-11	Questions	Fetch all questions	200: Array of questions returned	Pass
TC-12	Questions	Upvote a question	200: upvoteIds updated; reputation +5	Pass
TC-13	Questions	Delete own question	200: Question removed from DB	Pass
TC-14	Answers	Post answer to a question	201: Answer saved; noOfAnswers incremented	Pass
TC-15	Answers	Post empty answer	400: Answer body required	Pass
TC-16	Answers	Upvote an answer	200: upvoteIds updated; reputation +10	Pass
TC-17	Answers	Accept an answer (question owner)	200: isAccepted=true; reputation +15	Pass
TC-18	Answers	Accept answer as non-owner	403: Forbidden	Pass
TC-19	Comments	Add comment to question	201: Comment saved	Pass
TC-20	Comments	Add comment with empty body	400: Comment body required	Pass
TC-21	Articles	Create article with title and body	201: Article saved	Pass
TC-22	Bookmarks	Bookmark a question	200: Bookmark added to user.bookmarks	Pass
TC-23	Bookmarks	Remove a bookmark	200: Bookmark removed	Pass
TC-24	Search	Search with matching keyword	200: Matching questions returned	Pass
TC-25	Search	Search with no matches	200: Empty array returned	Pass

TC #	Module	Test Description	Expected Result	Status
TC-26	Notifications	Fetch notifications for user	200: Array of notification objects	Pass
TC-27	Notifications	Mark notification as read	200: read=true updated	Pass
TC-28	Profile	Update user bio and avatar	200: Profile fields updated	Pass
TC-29	Profile	Fetch user by ID	200: User object returned	Pass
TC-30	Rate Limiting	Send 25 auth requests in 15 min	429: Too Many Requests after 20th	Pass

Test Coverage Summary: All 30 test cases passed. No critical defects. Minor UI alignment issues identified and resolved during the testing phase.

7.2 Screenshot of Testing

The following screenshots were captured during manual testing:



Testing Figure 1: Authentication Test

BugOverflow About Questions java A Log out

Ask a public Question

Title

Be specific and imagine you're asking a question to another person

SQL - Combine multiple rows into a single row for a Join with a one-to-many relationship

Body

Include all the information someone would need to answer your question

```
2  |  Other Name    |  Other Description   |  12.99  |  2
2  |  Other Name    |  Other Description   |  12.99  |  3
3  |  Another Name  |  Another Description |  15.99  |  3
3  |  Another Name  |  Another Description |  15.99  |  1
```

However, I want to group the category Id's to look like this:

```
1  |  Test Name     |  Test Description    |  9.99   |  1,2
2  |  Other Name    |  Other Description   |  12.99  |  2,3
3  |  Another Name  |  Another Description |  15.99  |  3,1
```

To achieve this I had found another another solution that suggested using STRING_AGG() but this did not work for me and I got an error saying:

```
'STRING_AGG' is not a recognized built-in function name
```

My Query looked like this:

```
SELECT
    [Item]."Id",
    [Item]."Name",
    [Item]."Description",
    [Sales Price]."Unit Price",
    STRING_AGG([Item Category]."Category Code", ',')
FROM
    [Item]
INNER JOIN
    [Sales Price]
ON
    [Item]."Id" = [Sales Price]."Item Id"
INNER JOIN
    [Item Category]
ON
    [Item]."Id" = [Item Category]."Item Id"
```

I usually work in a LAMP/WAMP env with basic mySQL and am new to working with SSMS and this type of query. I am using SSMS v22.3.2

IMPLEMENTATION

This section describes how to deploy and use the Bug Overflow application.

8.1 User Guide

Registering an Account

Click "Sign Up" on the navigation bar. Enter your name, email address, and a strong password (minimum 6 characters). Click "Register". An OTP will be sent to your email. Enter the OTP to verify your account. You will be logged in automatically.

Posting a Question

Click "Ask Question" from the home page or navigation bar. Enter a clear, descriptive title (minimum 15 characters). Write your question body using the rich-text editor — format code blocks, add bold/italic text, and insert bullet lists. Add relevant tags. Click "Post Your Question".

Submitting an Answer

Navigate to any question detail page. Scroll below the question to the answer editor. Write your answer using the rich-text editor, including code snippets if needed. Click "Post Your Answer".

Voting on Content

Click the upward arrow (▲) to upvote a question or answer you find helpful. Click the downward arrow (▼) to downvote unhelpful content.

Voting updates the author's reputation score automatically: +5 for question upvotes, +10 for answer upvotes.

Accepting an Answer

If you are the question author, accept the best answer by clicking the checkmark (✓) icon next to any answer. Accepting awards +15 reputation to the answerer and highlights the accepted answer at the top of the thread.

Bookmarking Questions

Click the bookmark icon on any question card to save it to your personal bookmark list. View all bookmarks from "Bookmarks" in the navigation. Click again to remove the bookmark.

Using Search

Use the search bar in the top navigation to enter keywords. Results are ranked by relevance using MongoDB text indexes. Filter by tags by clicking any tag badge on a question card.

Viewing Notifications

The bell icon in the navigation bar shows your unread notification count. Click it to view all notifications about votes, answers, and comments on your content.

Publishing an Article

Click "Write Article" from the navigation. Enter an article title and use the rich-text editor to compose the full article. Add tags. Click "Publish". Your article will appear in the public Articles feed.

Viewing Your Profile

Click your username or avatar to view your profile page. Your profile displays your reputation score, earned badges (Informed, Enthusiast, Veteran, Expert), questions, answers, and articles. Click "Edit Profile" to update your bio and social links.

8.2 Installation Steps

Prerequisites

- Node.js 18+ and npm installed
- Git installed
- MongoDB Atlas account (free tier) or local MongoDB 6+
- A Gmail account for Nodemailer SMTP

Step 1 – Clone the Repository

```
git clone https://github.com/<username>/Bug-Overflow.git
cd Bug-Overflow
```

Step 2 – Configure Server Environment

```
# Create server/.env
CONNECTION_URL=mongodb+srv://<user>:<pass>@cluster.mongodb.net/bugove
rflow
JWT_SECRET=your_super_secret_jwt_key
EMAIL_USER=your_gmail@gmail.com
EMAIL_PASS=your_gmail_app_password
CLIENT_URL=http://localhost:3000
```

Step 3 – Install Server Dependencies and Start

```
cd server
npm install
node index.js
# Server starts on http://localhost:5000
```

Step 4 – Configure Client Environment

```
# Create client/.env
REACT_APP_API_URL=http://localhost:5000
```

Step 5 – Install Client Dependencies and Start

```
cd client
npm install
npm start
# App opens at http://localhost:3000
```

Step 6 – Production Build

```
cd client
CI=false npm run build
# Optimised build output in client/build/
```

CONCLUSION

Bug Overflow successfully demonstrates the development of a complete, production-ready full-stack web application using the MERN stack. The project achieves all 15 functional requirements and all 8 non-functional requirements defined during the system analysis phase.

The application implements a rich feature set including secure JWT-based authentication, a gamified reputation and badge system, real-time notifications, rich-text editing, full-text search, article publishing, and a responsive user interface. All 30 system test cases passed with no critical defects.

Key Learning Outcomes

- Proficiency in the complete MERN stack (MongoDB, Express.js, React.js, Node.js) including REST API design and NoSQL data modelling.
- State management with Redux Toolkit: global state slices, async thunks, and developer tooling.
- Security best practices: bcrypt password hashing, JWT tokens in HTTP-only cookies, DOMPurify HTML sanitisation, and express-rate-limit.
- Rich-text content handling: React Quill editor integration, output sanitisation, and safe HTML rendering.
- Agile development methodology: sprint planning, iterative feature delivery, and continuous testing.

- Software engineering practices: Git version control, modular code organisation (controllers/models/routes/utils), and comprehensive test case design.
- Cloud deployment: Vercel (frontend), Render (backend), MongoDB Atlas (database).
- Full-stack integration: connecting React SPA to Express REST API via Axios with JWT-based session management.

Bug Overflow demonstrates that a single developer can build and deploy a sophisticated, feature-complete web application that rivals commercial products by leveraging modern open-source technologies and following software engineering best practices. The project serves as a strong foundation for further enhancement and real-world deployment.

FUTURE ENHANCEMENT

While Bug Overflow is fully functional as submitted, several enhancements would further improve the platform in future versions:

WebSocket Integration (Socket.io)

Replace the current polling-based notification system with WebSocket connections using Socket.io for true real-time notifications, live vote count updates, and instant new-answer alerts without page refresh.

Advanced Search with Elasticsearch

Integrate Elasticsearch or MongoDB Atlas Search to provide full-text search with relevance ranking, typo tolerance, and faceted filtering by tag, date, vote count, and answer status.

Mobile Application (React Native)

Develop native iOS and Android applications using React Native, sharing the same backend REST API, significantly expanding Bug Overflow's accessibility and user base.

Duplicate Question Detection (NLP)

Use NLP models (e.g., Sentence-BERT) to detect semantically similar questions before posting, reducing duplicate content and improving search relevance.

Code Execution Sandbox

Embed a live code execution environment (similar to CodeSandbox or Replit) within editors, allowing users to run and share executable code snippets directly on the platform.

Bounty System

Allow question authors to offer reputation points as a bounty to incentivise answers to difficult, unanswered questions — a key Stack Overflow feature.

Admin Moderation Dashboard

Build an admin panel for content flagging, review queues, user ban management, and automated spam detection using keyword filtering or ML classifiers.

Swagger API Documentation

Generate interactive API documentation using Swagger UI so third-party developers can integrate with Bug Overflow programmatically.

Dark Mode / Theme Toggle

Implement a dark/light theme toggle persisted in localStorage, reducing eye strain for developers who prefer dark interfaces.

Internationalisation (i18n)

Add multi-language support using react-i18next to make the platform accessible to non-English-speaking developer communities.

CI/CD Pipeline

Set up automated continuous integration and deployment using GitHub Actions to run tests, build the Docker image, and deploy to cloud on every push to the main branch.
